Technical Maturity: Decouple data, generation, posing, and rendering through clear contracts. Master lifecycle management, resource cleanup, error states, versioning, and reproducible results. The framework must be usable in another Godot game without the workshop interface.

Tooling Quality: Parameters respond predictably, undo/redo preserves work, presets and exports are reliable, and progress and errors are clearly communicated. The UI must enable focused work for developers or artists.

Verification & Iteration: verify technical and visual results, identify specific shortcomings, and fix their root causes.

Plan the implementation so that sufficient time remains for artistic refinement, animation polish, integration, and stabilization. Do not unilaterally lower the agreed scope or quality standards to declare completion earlier. If faced with a hard environment or session limit, save a precise checkpoint and explicitly mark the result as incomplete

Model the below items using the gauntlet review skill, below.

`~/.claude/skills/reference-gauntlet/SKILL.md` (user-level, so it works in any project). Invoke it with `/reference-gauntlet`

Some items should be modeled as equippable items, or an environment. Use your judgment to discern.

Sniper to be modeled

Shotgun to be modeled

Slingshot to be modeled

shooter hallway map to be modeled (unshown items can be treated as barriers or boundaries)
